## **Introduction:**

### **1.1 Project Overview:**

The Hospital Management System is a web-based application developed to efficiently manage various operations in a hospital setting. The system allows users with different roles, such as administrators, doctors, and patients, to perform their respective tasks seamlessly. It provides functionalities like patient registration, appointment scheduling, medical history management, and more.

### **1.2 Group Members:**

## **Project Requirements:**

### **2.1 Functional Requirements:**

The functional requirements of the Hospital Management System include:

User registration and login functionality for administrators, doctors, and patients.

Admin module with features like patient and doctor management, appointment tracking, and report generation.

User module allowing patients to book appointments, view medical history, and update their profile.

Doctor module providing doctors with access to patient information, appointment history, and profile management.

### **2.2 Nonfunctional Requirements:**

The nonfunctional requirements of the system encompass aspects such as:

User-friendly and intuitive interface design for easy navigation and usage.

Security measures to protect patient data and ensure privacy.

Performance optimization to ensure fast data processing.

Compatibility with popular web browsers like Mozilla, Google Chrome, IE8, and Opera.

Development Tools and Technologies:

### **3.1 Programming Language:**

The project is developed using PHP, specifically PHP5.6 or PHP7.x, for server-side scripting.

### **3.2 Database:**

MySQL 5.x is used as the database management system to store and retrieve data efficiently.

### **3.3 Web Technologies:**

The user interface design of the system is based on HTML, AJAX, jQuery, and JavaScript. These technologies facilitate dynamic and interactive web pages.

### **3.4 Integrated Development Environment (IDE):**

An appropriate IDE, such as PhpStorm, NetBeans, or Visual Studio Code, can be used for PHP development. These IDEs offer features like code completion, debugging, and version control integration.

## **System Architecture:**

### **4.1 Database Design:**

The system's database is designed to store relevant information such as patient details, doctor records, appointment history, and user credentials. It utilizes the relational model to establish relationships between entities and ensure data consistency.

## 4.2 User Interface Design:

The user interface is designed using HTML, CSS, and JavaScript to create an intuitive and visually appealing web application. AJAX and jQuery are employed to enhance user experience by enabling asynchronous data retrieval and dynamic page updates.

## 4.3 Module Descriptions:

### The Hospital Management System consists of three main modules:

**Admin Module:** This module allows administrators to manage doctors, patients, appointments, and queries. It includes features like patient search, appointment history, and user management.

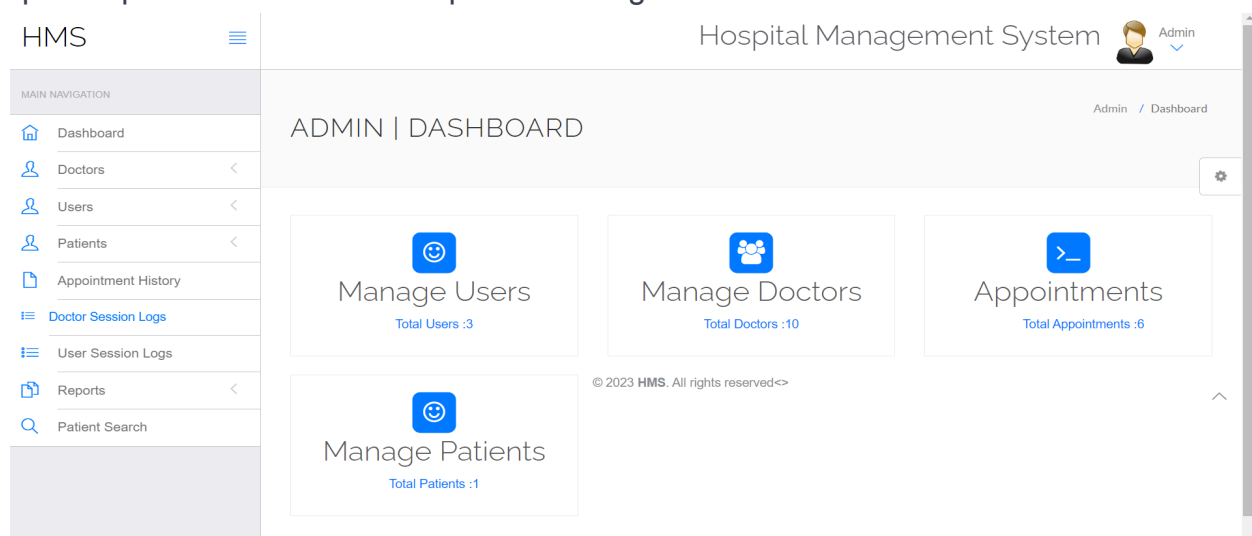

**User Module:** The user module is specifically designed for patients. It enables them to book appointments, view their appointment history, update their profile, and access their medical history.

**Doctor Module:** The doctor module is designed for doctors. It provides access to their profile, appointment history, patient management, and search functionality.

Implementation:

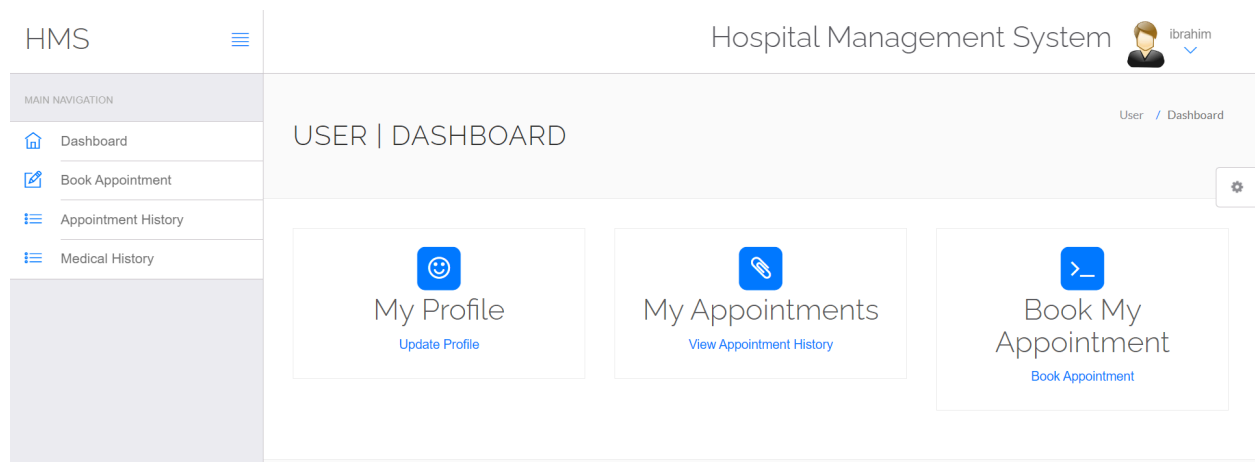

## 5.1 Admin Module:

The admin module includes a dashboard that provides an overview of patients, doctors, appointments, and new queries. Admins can add and update doctor specializations, view user details, and manage patients. They can also generate reports based on specific periods and search for patients using their names or mobile numbers.

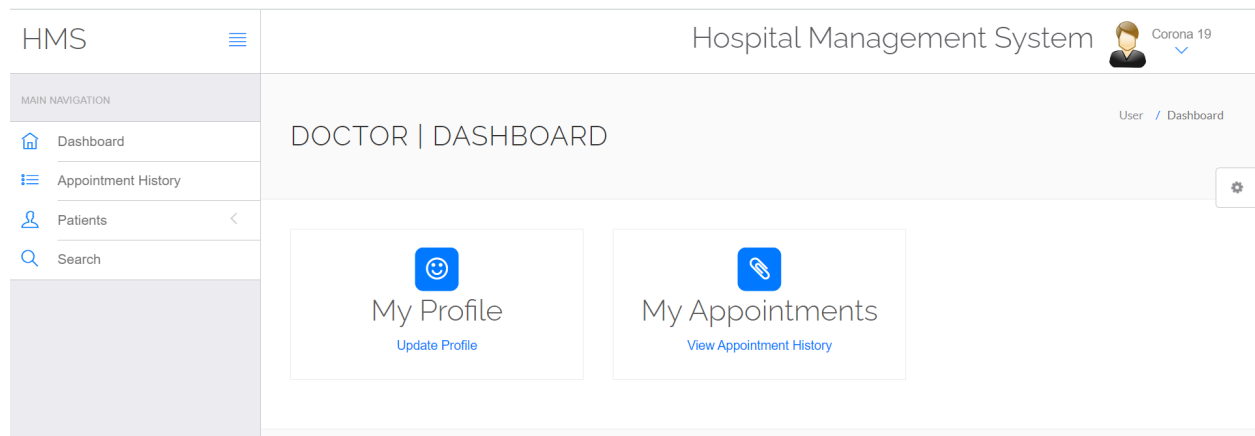

## 5.2 User Module:

The user module allows patients to view their profile, book appointments, and access their appointment history. They can also view their medical history and update their profile information. Password recovery functionality is also provided for user convenience.

## 5.3 Doctor Module:

The doctor module provides doctors with a dashboard to view their profile and online appointments. They can access the appointment history of patients, manage patients' records, and search for patients based on their names or mobile numbers. Like the user module, doctors can update their profile information and recover their passwords if needed.

## Testing and Quality Assurance:

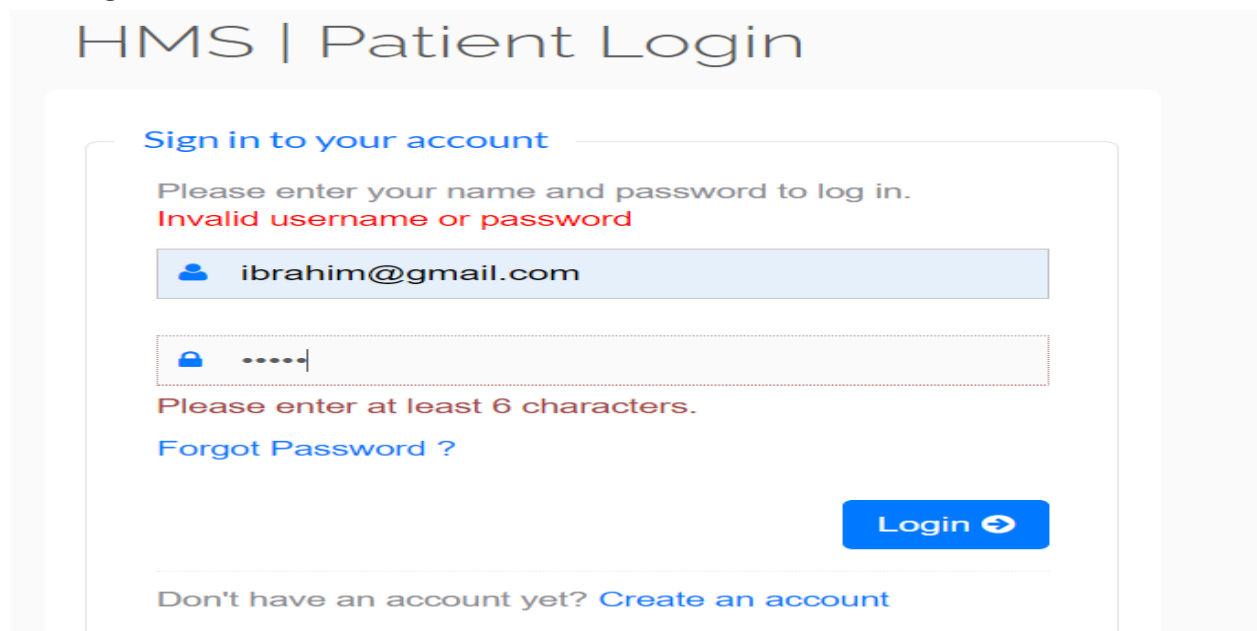

### 6.1 Testing Approaches:

To ensure the reliability and functionality of the Hospital Management System, various testing approaches can be employed. These may include unit testing, integration testing, and system testing. Unit testing focuses on testing individual components, while integration testing verifies the interaction between different modules. System testing ensures that the system meets the specified requirements as a whole.

## 6.2 Test Cases and Results:

Test cases can be designed to cover different scenarios such as user registration, appointment booking, data retrieval, and user interface interactions. The results of the test cases should be documented, including any identified defects or issues.

If wrong Password entered

The screenshot displays the 'HMS | Patient Login' interface. It features a 'Sign in to your account' section with a prompt to enter name and password. A red error message, 'Invalid username or password', is shown below the input fields. The username field contains 'ibrahim@gmail.com' and the password field is masked with dots. A red error message, 'Please enter at least 6 characters.', is displayed below the password field. A 'Forgot Password ?' link is present. A blue 'Login' button with a right arrow is located at the bottom right of the form. At the bottom of the page, there is a link to 'Create an account' for users who do not have an account yet.

When Registering and typing the password and typing it again for password confirmation and the passwords do not match this happens.

localhost says  
Password and Confirm Password Field do not match !!

### 6.3 Quality Assurance Measures:

Quality assurance measures should be implemented throughout the development process. This may include code reviews, adherence to coding standards, documentation, and continuous integration. Security measures should also be in place to protect sensitive data.

### Conclusion:

#### 7.1 Project Summary:

The Hospital Management System is a comprehensive web-based application developed using PHP and MySQL. It provides functionalities for administrators, doctors, and patients, allowing them to manage their respective tasks efficiently.

#### 7.2 Achievements and Challenges:

During the development of the system, achievements may include successfully implementing the different modules, ensuring data security, and providing a user-friendly interface. Challenges might include handling scalability, addressing performance issues, and incorporating robust error handling mechanisms.

#### 7.3 Future Enhancements:

Future enhancements could include adding features such as online payment integration, prescription management, inventory management, and analytics for decision-making. Improvements in the user interface, optimization for mobile devices, and integration with other healthcare systems can also be considered.

Overall, the Hospital Management System in PHP serves as a valuable tool for effectively managing hospital operations and improving patient care.
